Information and Technology Department

at the
Savannah River Site

a member of the Westinghouse Savannah River Company Team

Challenges are great when change is swift, especially when operating in a technical area such as information technology.

For a business as large and complex as the Savannah River Site, technology planning poses major challenges.

New technologies, vendors, and products constantly emerge, providing business solutions superior to those of the past. Such technologies affect long-held assumptions and force major business changes.

In addition, shorter product life cycles continue to drive aggressive replacement schedules.

The pace of change in information technology is as great as ever, and the Information Technology Department's potential impact on SRS business operations remains unprecedented.

The Information Technology Department at SRS offers career-developing opportunities for nearly every level of IT professional.

The department provides or supports extensive job and system-specific training as well as mentoring programs to enable the new engineer to become familiar with division and site practices.

Our IT Department is recognized as a high-tech team of problem-solving individuals. Information Technology Department goals for hiring new employees are based on the following focus areas:

- Alignment of Information Technology resources to more directly enable accomplishment of site missions,
- Partnering with site customers to optimize and integrate business processes,
- Alignment of the capabilities, price, and performance of IT infrastructure products to meet business needs,
- Implementation of enabling technologies that will support greater workforce collaboration and productivity,
- Ability to improve the quality,

integrity, and security of the site's Information Technology systems management.

There are specific technical strategies for IT products in the following non-process areas:

- core business applications
- division computing systems and support
- information delivery services
- computing and communications infrastructure, and
- IT planning and corporate management.
